CDNA libraries were prepared from human thyroid gland poly(A) RNA in lambda gtl1 and gtl0. These were screened using probes derived from DNA encoding similar enzymes in Xenopus laevis. Three clones were isolated from the gtl0 library, including gtl0chT201.

Restriction analysis indicated that gtl0chT201 encodes a different type of enzyme to the other two clones. The DNA can be inserted type of enzyme to the other two clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lambda gtl0ch201 encoded C-terminal alpha amidating enzyme. C-terminal alpha amidating enzyme; human thyroid gland; lambda gtl0ch201.

PS Claim 12: Figure 2: 107pp; English.
CC The full-length TPKS-encoding DNA in plasmid pLoA was CC designated pTPKS100. Splicing of the introns from the DNA CC sequence and translation of the 9114 nt ORF results in a CC protein of 3038 AAs (R74]71) with a mol. wt. of 269,090 CC protein of 3038 AAs (R74]71) with a mol. wt. of 269,090 CC daltons. Inspection of the TPKS AA sequence for active called sites residues and motifs known to be associated with CC polyketide synthases and fatty acid synthase (FAS) activities cresulted in the identification of candidates for expected CC sites (see FT). Except for the presence of a methyl transferase, CC cont present in FAS, the succession of activities on the control of the presence of the p

                                                                                                                                                     Prodn. of alpha amidating enzyme - using prokaryotic or eukaryotic expression vectors having transcriptional promoter Claim 3; page 19; 24pp; English.
The corrsp. DNA sequence hybridises, under stringent conditions, with a DNA sequence (I) which encodes an alpha amidating enzyme (AEE) and is foreign to the host cell into which it is transformed. (I) is connected to a promoter and is contained in an expression vector. The AEE encoded is used as a catalyst in the conversion of a peptidyl substrate to a corresp. peptidyl amide. This can be used for making a protein biologically active, e.g. calcitonin or growth hormone releasing factor. See also Q05637.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1463 GlyPheAsnSerTyrThrTyrThrAspIleSerThrGlyPhePheGluGl 1479

The sequence was deduced from the DNA sequence determined from clone isolated from a library prepd. from mRNA extracted from horse atrium tissue. The sequence is one of four similar ones provided which all have the same sequence up to residue 809 at which point they diverge, having different C-termini. The different termini are created by deletions in the last portion
                                                                                                                                                                                                                                           obtd.

N;Alternate names: peptidylhydroxyglycine N-C lyase
C;Species: Xenopus laevis (African clawed frog)
C;Date: 22-Nov-1993 #sequence_revision 03-Aug-1995 #text_change 18-Jun-1999
C;Accession: S17855
